

## EXECUTIVE SUMMARY (for the UN, EU, OECD, African Union, BRICS, NGOs)

USL1 is the first step of a set of new breakthrough proposals that will make it possible for us to resolve most of the toughest global challenges at least from economic and budgetary points of views because each of the crises like the 95% transition to Renewable Energy or Eurozone public debt crises requires roughly 4-8% of the GDP annually for each government to resolve and still will take 30-40 years or more. The less ambitious plans like SE4All (1-2% of GDP) and POST-2015 (0.2-0.5% of GDP) of the UN are still considered very burdensome to most countries. If you combine them all and other key environmental or resource challenges, our estimates show that **the average governments need to spend roughly 10-20% of their annual GDPs to resolve most of them by around the 2050 time frame**, which is too much for any government, NGO and the UN. **USL1** is an attempt to shift the focus from the traditional distributions of finances based on the scarcity and its market-based competitions to the so-far-unexpected, very rapid boosts in both the growth rates in both the Real GDP per capita and nominal GDPs by using USL1 and creating a binding international treaty to protect the environment and natural resources and by driving the non-material & circular economy-based growths while halving the global population growth by 2050 as well. All these are possible because USL1 **will add roughly the 2% surplus Real GDP per capita growths** throughout the rest of this century **by advancing national average school math by 2 years (without USL1, this will take 40-80 years) with the reform time of 2-5 years (to complete by 2020).**

**The 2% of the Real GDP per capita boost by USL1** will induce the following 3 key properties:

1. Roughly halving the GDP doubling time (an unprecedented boon for any government)
2. Roughly doubling the population doubling time (halving population growth)
3. Doubling or tripling Real GDP per capita doubling time (critical for the UN and NGOs)

### **Key Implications:**

- OECD countries' **Surplus Real GDP per capita** increasing average 15%+ per 10 year,
- World nominal GDP doubling every 10-13 years instead of 20-25 years.
- With USL1, to resolve all these top global crises will need annually about 2-5% of GDP instead of 10-20% of GDP between 2020-2045 (for the global average).

Instead of abusing this new paradigm shift for the corporate concentrations of wealth, we try to create the equal partnership global social enterprises where all governments and the UN equally participate, and induce the 2x-3x the UN budgets. The details are left to the UN and governments.

### **What to do now (as soon as possible):**

To open multi-logues to explore this possibilities together & verify the claims of USL1 proposals and run some quick new pilot studies with the participations of various governments, NGOs and the UN to use their results to solidify the next step to a new international treaty with the UN.
